INTRODUCTION

Shortly after the May 2, 1983, $M_S=6.5$ earthquake near Coalinga, CA, the U.S. Geological Survey conducted a seismic refraction experiment in the area. The objective of the survey was to derive a detailed velocity model of the upper crust in this region. Such a model would provide further information on the geologic structure of the Coalinga area, as well as provide improved constraints for determining earthquake and aftershock hypocenters.

Two seismic refraction profiles intersecting in the epicentral region of the Coalinga earthquake aftershocks (Figure 1 and Plate 1) were recorded in May and June of 1983. An east-west trending profile extended from the Diablo Range west of Coalinga, across the source region of the aftershocks, and into the San Joaquin Valley near the town of Lemore, CA. A northwest-southeast trending profile extended from the Diablo Range north of Coalinga, across the source region, and southward along the western edge of the San Joaquin Valley to a point 20 km west of the town of Lost Hills, CA. Figure 1 shows the location of these profiles in relation to the local geology. The geologic setting and a preliminary interpretation of this data are presented by Walter and Mooney (1983).

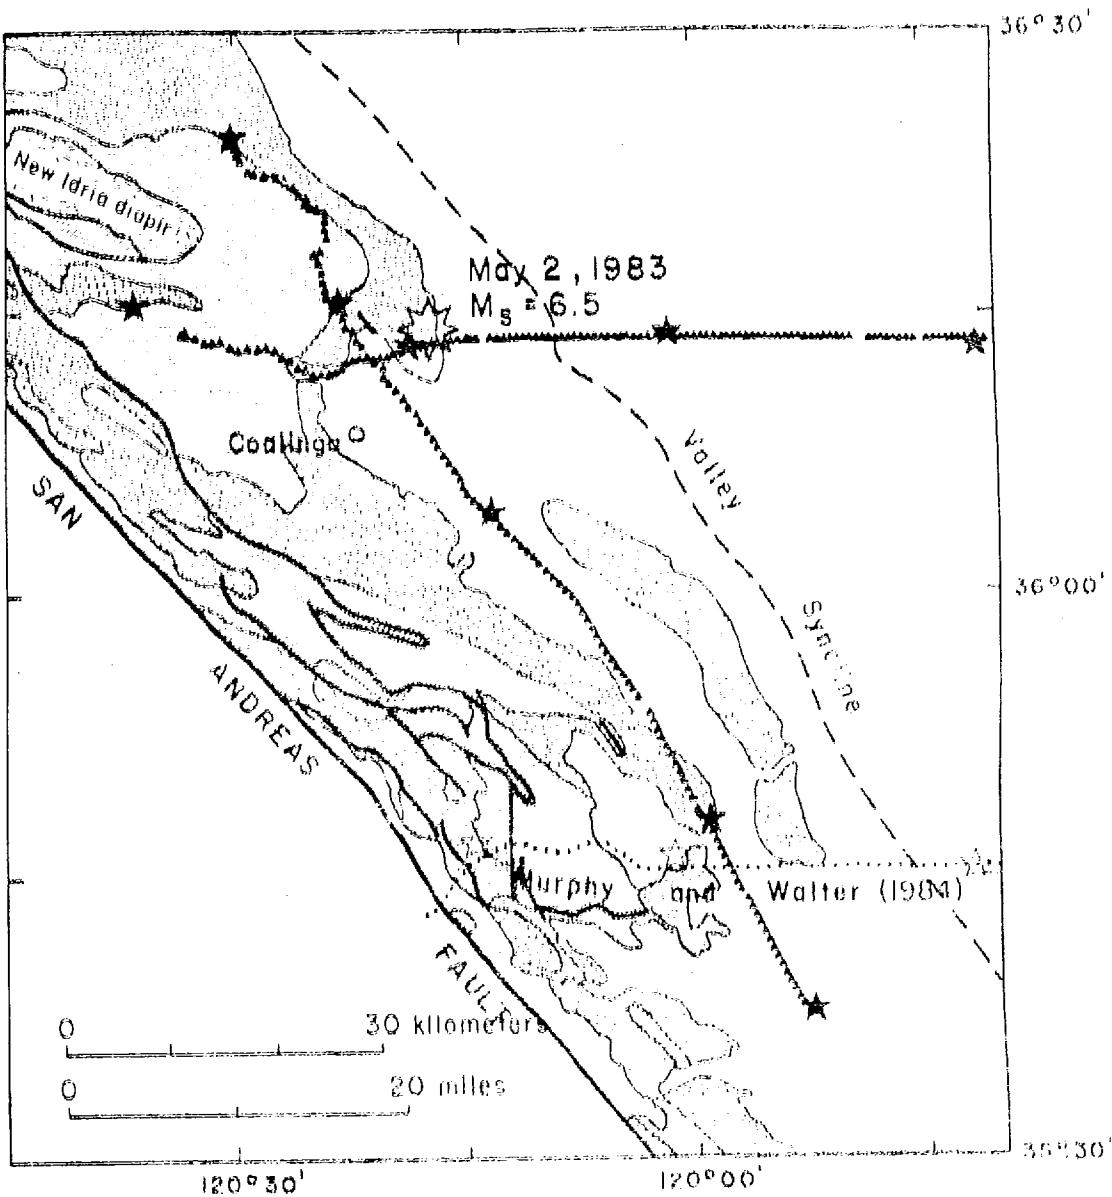

This report is a compilation of the data obtained from the 1983 seismic refraction surveys. A detailed interpretation of this data will be published separately.

DESCRIPTION OF SURVEY

The 1983 Coalinga seismic refraction data supplement seismic refraction data reported by Murphy and Walter (1984) for a survey conducted between Morro Bay, CA and the foothills of the Sierra-Nevada. The Morro Bay refraction survey includes two end-to-end profiles along which eight shotpoints are distributed. The northwest-southeast (NW-SE) Coalinga profile intersects the Morro Bay line at a point 59 km south east of the east-west (E-W) Coalinga profile (Figure 1).

For the E-W Coalinga profile, one-hundred and twenty seismic recorders were deployed along an 83-km long line with shots fired at 4 shotpoint locations (SP 9-12, see Plate 1 and Table 1). For the NW-SE profile, these same instruments were deployed along an 103-km long line with shots fired at 5 shotpoint locations (SP 13-17, see Plate 1 and Table 1). The instrument and shot point locations and elevations were determined to an accuracy of 15 m using USGS 1:24000 topographic maps (Appendix A, Table 1). The shot point number refers to the location of the shot, whereas the shot number refers to the time sequence of the shot. This numbering system is useful for cases where the same shotpoint is fired twice.

The nine shot holes were 20 cm in diameter and had a typical depth of 45 m. The holes were loaded with 2000 to 3200 pounds of ammonium nitrate explosive. The shots were fired automatically by a shooting system described by Healy and others (1982). A signal from a reference clock triggered the

shooting system to fire an electric blasting cap. The cap break, WWVB time code, and the reference clock's IRIG E time code were recorded by a paper strip chart recorder. The cap break was assumed to be instantaneous with the shot detonation; the shot times are accurate to within ± 2 milliseconds. Table 1 lists the time, location, and the amount of explosive loaded (when available) for each shot.

INSTRUMENTATION AND DATA REDUCTION

Seismic Recorders

Each instrument (Healy and others, 1982) contains a 2-hz vertical component geophone. The signal from the geophone is sent through three parallel amplifiers, each with an adjustable gain setting. The three amplified seismic signals, a fixed reference frequency, and a frequency modulated, internally generated time code are recorded as a multiplexed signal in analog form on a cassette tape (Figure 2). Each instrument contains a USGS time code generator (clock) with a memory board that can be programmed for up to ten separate recording times. The response curve for the system peaks at about 20 hz (Figure 3). The instruments are powered by two 6-volt rechargeable batteries.

Before each deployment, field technicians program the recording times and synchronize the clock unit of each instrument with a master reference clock, the same type of clock that triggers the shooting system. After the instruments are retrieved, the clock drift for each instrument is measured relative to the master clock and recorded on data sheets. The master clock, which drifts approximately 1 millisecond a week, is synchronized to a Rubidium standard reference at the USGS Western Regional Headquarters in Menlo Park, CA. The Rubidium clock, accurate to 10^{-10} parts per unit time, is periodically set to an averaged WWVB reference signal.

Data Reduction

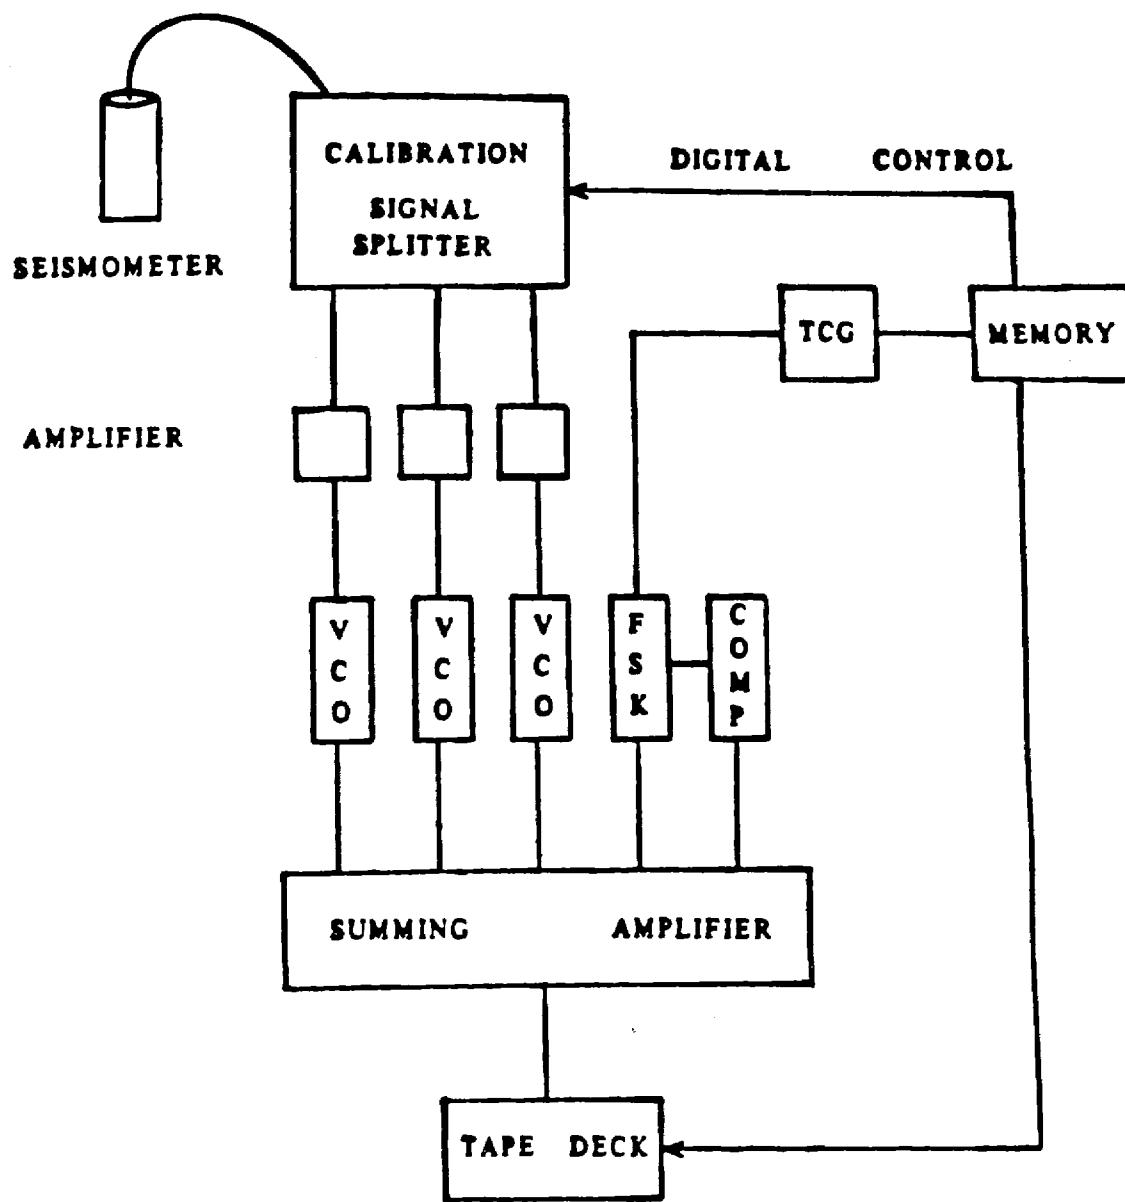

Field technicians complete instrument data sheets that include information on instrument location, amplifier gain settings, clock drifts, and instrument performance. This information is entered into a micro-computer and stored on a floppy disk (Appendix B).

After the instrument and shot data are entered into the computer, the analog seismic data recorded on each cassette are digitized using a micro-computer system. For each shot, the data are digitized for 20 seconds, starting T seconds after shot time:

$$T \text{ (seconds)} = X/6 = 2$$

where X equals the distance between the shot point and the seismic recorder in kilometers. The seismic data are digitized at a sampling rate of 200 samples/sec and are written to floppy disks.

After the seismic data are digitized, the traces are evaluated for data quality. A tape grade code is assigned to each trace (Appendix B). Traces are usually deleted from the record sections where a very large background noise level results in a low signal-to-noise ratio. The final version of digitized data is archived on 9-track magnetic tape.

COMP = COMPENSATION
FSK = FREQUENCY SHIFT KEYING
TCG = TIME CODE GENERATOR
VCO = VOLTAGE-CONTROLLED OSCILLATOR

Figure 2. Schematic diagram of seismic recorders

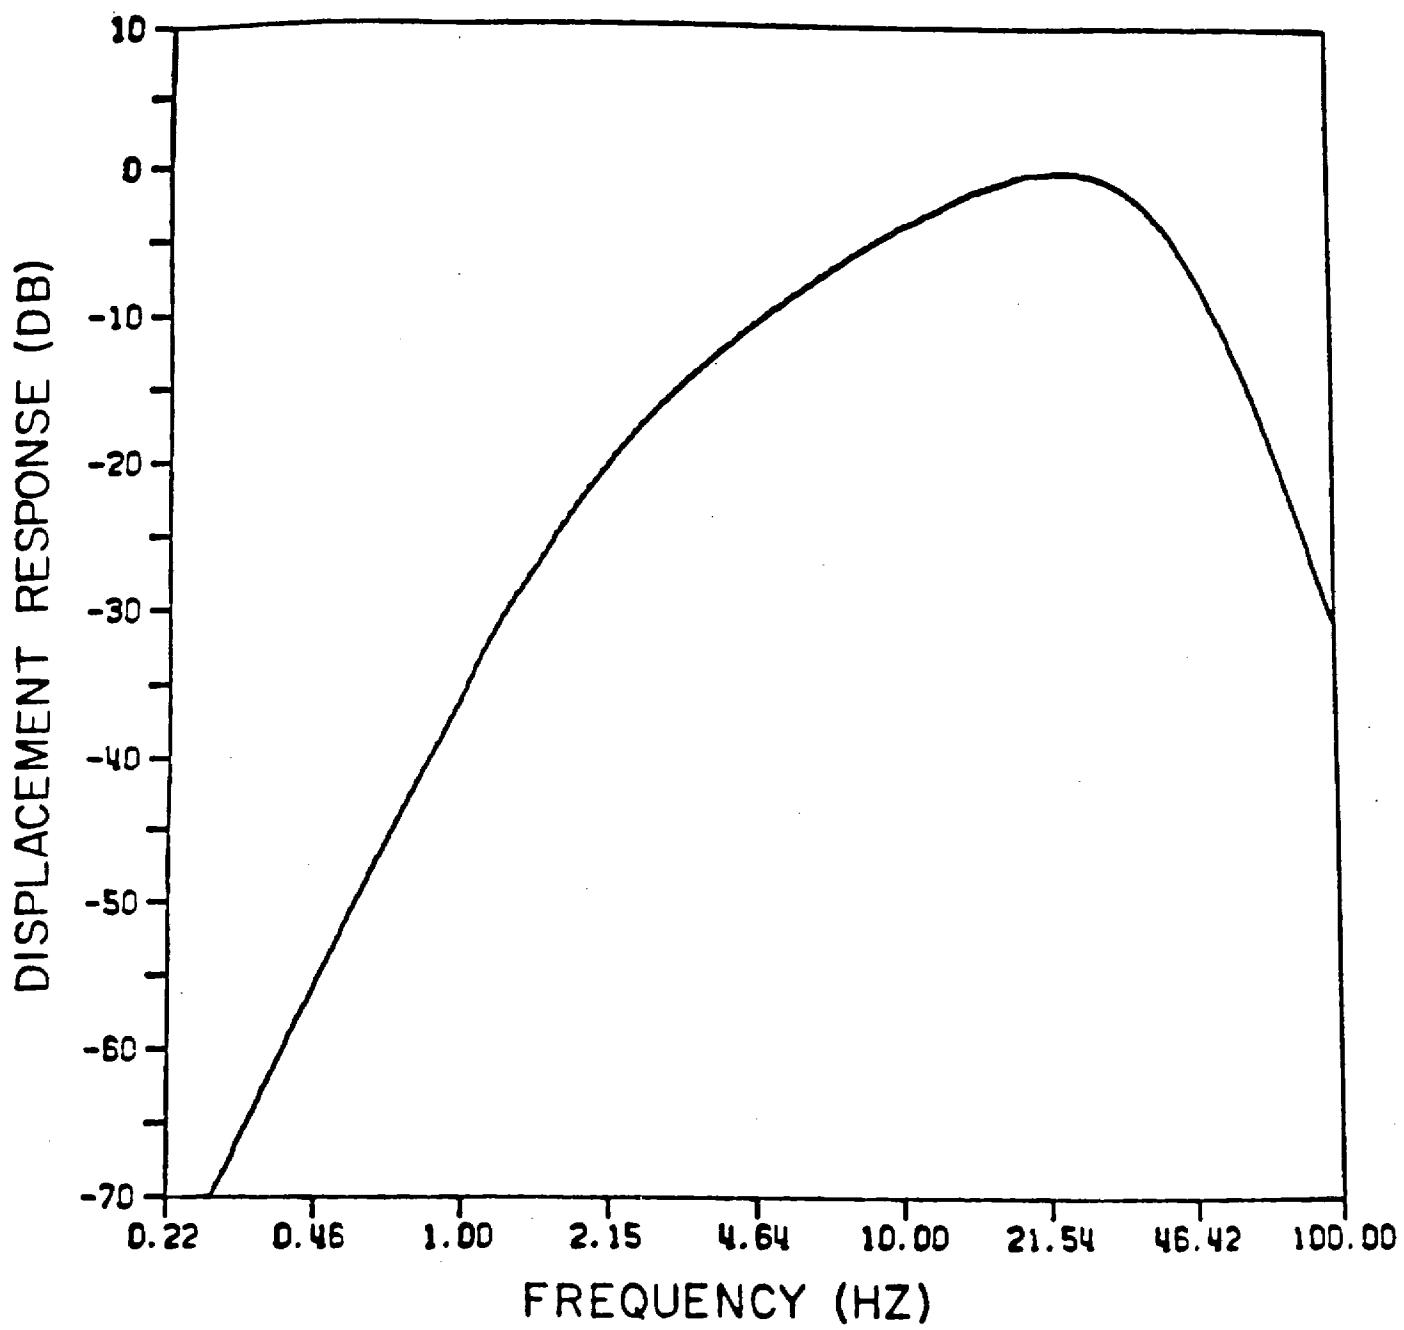

Figure 3. System response curve for cassette recording units with 2 Hz seismometers

First arrival times (Appendix C) are determined by plotting the seismic traces on a computer graphics terminal. Computer generated crosshairs are used to pick the arrival time on each trace. For clear, impulsive first arrivals the times are picked with 10 ms accuracy, but the uncertainty may be as great as 50 ms for more emergent arrivals.

RECORD SECTIONS

The record sections for each shot are presented on Plates 2-10. For each shot, a normalized and a true-amplitude record section are shown. The record sections are plotted with the time reduced by a velocity of 6.0 km/sec; i.e. the time shown for each trace is defined as:

$$T = X/6$$

where T is the absolute elapsed time (seconds) from the shot instant and X is the shot-to-receiver distance (km). Negative distances indicate instrument locations west of the shotpoint on the E-W line, and SE on the NW-SE line. Each record section is plotted at a scale of 5 mm/km for the distance axis and 25 mm/sec for the time axis. The normalized traces are plotted with a uniform maximum amplitude of 7.5 mm.

For the true-amplitude record sections, the width of each trace represents its actual amplitude after adjustments for instrument gain, distance from the shot point, and shot efficiency. The true amplitude $A(t)$ is computed from the observed amplitude $A_0(t)$ by

$$A(t) = A_0(t)f_a f_d f_g$$

where f_a , f_d , and f_g are multiplicative factors adjusting for the instrument amplifier gain, distance from the shot, and shot efficiency, respectively.

The multiplication factor for amplification is:

$$f_a = 10(\text{dB}/20)$$

where dB is the gain attenuator setting of the selected channel in decibels for each trace. The multiplication factor for distance is:

$$f_d = (\text{Shot-receiver distance})^2$$

The shot efficiency factor, f_g , is an arbitrary scalar multiplier that is inversely proportional to the signal strength of each shot. An optimum value of f_g is one that clearly shows the relative amplitudes of the traces on the true amplitude record sections. The values of f_g chosen for this report are included in Table 1.

Some trace amplitudes were extremely high due to excessive cultural noise, causing these traces to overlap adjacent traces on the true amplitude record sections. Other trace amplitudes were unrealistically low on the true amplitude record sections because of a seismic recorder amplifier problem.

All of these traces were deleted from the true amplitude plots but retained for the normalized plots. There were also cases where a trace was distorted by relatively high frequency noise (30 hz or greater). These traces were left unfiltered on the true amplitude record sections, but were filtered on the normalized record sections using a 1-15 hz bandpass filter. The tape grade code (Appendix B) indicates which traces were affected by the above circumstances.

The signal-to-noise ratio of the data is affected by cultural noise at the recorder sites and by how well the shot energy coupled with the ground at the shotpoint. The signal-to-noise ratio is particularly low for SP 11 (Plate 4) and SP 17 (Plate 7) due possibly to poor shot-ground coupling or incomplete detonation of the explosive. The shot signal rapidly disappears into the background noise past 23 km east of SP 11; no traces beyond 36 km east of SP 11 are plotted. For the SP 17 record sections the shot signal can be seen to only 25 km NW of SP 17. No traces past 50 km NW of SP 17 are plotted on the true amplitude record section due to high noise levels. On the SP 10 record sections (Plate 3), phase arrivals from a small Coalings aftershock interfere with the shot arrivals 25 km and beyond west of the shotpoint.

Due to an unfortunate misunderstanding in the field, the nearest functioning recorder to SP 12 (location number 719) was placed 6 km away.

Traces 1159 and 1160 (between SP 13 and SP 14) overlapped on three shots for the NW-SE profile. Trace 1160 was deleted from these record sections because it is slightly noisier and because the site is farther off line from the shortest distance between SP 13 and SP 14 (Plate 1). These changes are listed in the tape grade code.

ACKNOWLEDGEMENTS

The authors would like to express their appreciation to A. Bloomfield, L. J. Hwang, J. H. Luetgert, P. J. Meador, J. M. Murphy, T. J. Reed, and V. D. Sutton for their diligent work in recording data and locating instrument sites. Also appreciated is field support provided by C. J. Criley, E. E. Criley, G. S. Fuis, S. K. Gallantine, A. L. Locquiao, G. A. Molina, and L. J. Pace. L. Y. Hsu and R. L. Ingram spent endless hours digitizing data tapes. G. S. Fuis, W. D. Mooney and J. M. Murphy helped plan the experiment.

APPENDIX B

Team Data Sheets

The data sheets contain all the information related to the performance of the seismic recorders. This appendix provides a computer printout of this information as stored on a floppy disk. The recorders are grouped into six teams of twenty instruments. Each set of teams is listed in shot order. The shot time lists the Julian day and the GMT hour, minute, and second. The column headings are as follows:

LOC	- field location number of the seismic recorder unit
DIST (KM)	- distance from the shot point to the recorder location in kilometers
AZIM	- azimuth from the shotpoint to the recorder location measured clockwise from north
UNIT	- I. D. number of the recording unit
CHRON	- time correction in milliseconds for the recorder clock at shot time (calculated from the total drift assuming a linear drift rate)
CHAN	- seismic channel number (1, 2, or 3) which was digitized
C1 C2 C3	- gain attenuator settings (dB) for a given channel
TAPE GRADE	- number that codes the instrument performance, the data quality, and/or the reason for omitting the trace from a record section

DIRECTORY OF TAPE GRADE CODES

- 0 - Seismic record digitized
- 1 - Recorder did not operate; tape did not advance
- 2 - Tape advanced but no signal was recorded
- 3 - Skipped recording time
- 6 - Weak signal; low recording level;
cannot interpret time code
- 7 - Continuous calibration by recorder unit
- 8 - Noise, sinusoidal
- 9 - Noise, spike
- 10 - High frequency noise; trace filtered
for normalized plots (1-15 hz bandpass filter)
- 11 - High amplitude cultural noise;
not used for true amplitude plots
- 12 - High cultural noise; poor signal to noise ratio
- 13 - Defective clock unit
- 17 - Noisy time code record
- 18 - Tape speed incorrect; belt slipped
- 20 - Unit not deployed
- 21 - Geophone disconnected or shorted
- 24 - Late start; missed shot time
- 25 - Geophone response test failed
(usually no seismic signal)
- 26 - One or more seismic channels missing
- 28 - Unit damaged in field
- 29 - Incorrect program time
- 31 - amplifier out of balance;
trace not used for true amplitude plots
- 32 - Crossfeed on time code due to strong seismic signal;
timing accuracy of only ±20 milliseconds
- 34 - Trace deleted from record section to prevent
the overlapping of adjacent traces

APPENDIX C

First Arrival Times

Appendix C is a listing of the first arrival times picked off of the record sections. Included are: shotpoint number, recorder site location number, absolute and reduced ($T - X/6$) travel times, and the distance (km) and azimuth (deg) of the recorder from the shotpoint.

SHOT POINT	RECORDER LOCATION	TRAVEL TIME (REAL)	TRAVEL TIME (T-X/6)	DISTANCE	AZIMUTH
9	723	0.495	0.367	0.770	18.163
