1982 Kilauea (South Flank/East Rift Zone), Hawaii Experiment

The University of Wisconsin-Madison deployed an array of 11 3-component digital seismographs along the East Rift Zone of Kilauea volcano from late March to the end of April 1982 to study details of South Flank earthquakes [Savage and Meyer, 1985] (Figure 1). Three UW seismographs were co-sited with Hawaii Volcano Observatory (HVO) stations (W13, W14, and W16). The largest magnitude event recorded during the UW deployment was an $M_L = 4.2$ event on April 12, 1982 at 02:04:02.37 UT [Savage and Meyer, 1985]. The increase in local coverage and in accuracy of S-phase determination yielded improved event locations, with inclusion of smaller events than in previous studies using HVO data alone [Savage, 1984]. Event data collected by the temporary network from March to April 1982 are being made publicly available through the IRIS DMC as part of a NSF-supported project to archive historic UW-Madison digital seismic datasets collected by the research group of Prof. R. P. Meyer.

Data Collection and Processing

Data were recorded in triggered mode for all stations. Table 1 presents the station coordinates. Table 2 contains the SEG-Y headers set during the UW-to-SEG-Y format conversion process. Clock corrections are incorporated into the SEG-Y data. The data have been assembled in the form of an event volume. Table 3 lists the events based on information from Savage [1984].

Tape Provided

The data archive consists of one DAT tape with the event-volume data (in PASSCAL SEG-Y format), this report in postscript and RTF formats, and miscellaneous information.

UW Seismic Recorders

The University of Wisconsin-Madison portable digital seismic recorders are wide-dynamic-range instruments (106 dB) designed for recording seismic waves from earthquakes or explosions (Table 4) [Powell, 1983]. Data from 1-Hz Hall-Sears HS-10-1 geophones were recorded at 100-Hz sampling rates, with a 4-pole Butterworth anti-aliasing filter at 24 Hz. A 13.6 kHz Omega receiver incorporated in each seismograph recorded data from the worldwide Omega navigational network concurrently with seismic signals. A timing-correction process developed for application to the UW seismic recorders provides 1/4 sample rms time error relative to Universal Time [Schneider et al., 1987]. Ground motion may be estimated from an average value for voltage sensitivity of 150 V/m/s for the UW Hall-Sears geophones.

(One project participant reported a 12 db (factor of 4 gain constant) increase for the horizontal versus vertical components per station. The PASSCAL segy Gainconst headers have been set to the same gain value for both vertical and horizontal components based on instrument configuration notes of Lee Powell.)
